

Seeds to maturity: Growing a better root system on shade trees

Dr. Ed Gilman, Professor
Environmental Horticulture Department
University of Florida

Web site: google Ed Gilman

Book: Illustrated Guide to Pruning, third edition, 2012

38 per section

Roots are complicated!

I dug my first tree roots up in 1977
and I am still learning!

I routinely kill perfectly healthy trees (Gilman et al. 2010)

That's how we learn about roots (Gilman 2007)

I will show you

- Natural vs. nursery-grown root systems
- Source and consequences of root defects
- How to grow quality root systems in containers and field nurseries
- Removing root defects at landscape planting
- Tree stability after planting

Outline for today

- Current situation
- Growing systems
- Planting issues

In nature, slow-impact root shift occurs

Deep roots
dominate early,
shallow roots
later

Roots grow down and out in drained soil

Root flare

Straight
horizontal
surface
root

Sinker
roots

Flat trunk
diving into
soil

Roots graft to roots of like species

Small tree

Large trees

A close-up photograph of a large tree trunk. The bark is dark, deeply textured with vertical ridges and grooves, and shows signs of weathering. Several large, thick roots emerge from the base of the trunk, spreading outwards and downwards into the ground. These roots are also covered in similar bark texture. The ground around the base of the tree is sandy and covered with dry, brown leaves and some small green plants. A black rectangular box with white text is overlaid on the right side of the image.

Large trees – visible
root flares

Small tree – suppressed root flare, inclusion around trunk

Root defects (Gilman et. al 2010)

Stem-girdling roots also lead to poor anchorage

The challenge

Typical urban root system?

Want this?

or this?

Want this?

or this?

Which
root ball
is best
suited
for
planting

How does this happen?

- 1) Trees begin in the field
- 2) Trees begin in a container

Seeds germinating in nursery field soil

Photo: Gary Watson

Here's what's going on
in the root system

Sudden impact

Pruning induced branching

No roots

Sudden impact

Pruning induced branching

No roots

Sudden impact

That is the origin of deep roots in root ball

1/4

How does this happen?

- 1) Trees begin in the field
- 2) Trees begin in a container

**Roots grow primarily
out the bottom**

Container grown

This has
a better
chance to
turn into
this than
the other
two

Working
Hypothesis:
This is ideal
root system

Quercus seeds into
containers, *Acer*
cutting into container

Roots are confined to container

**Root system too big for
containers so roots deflect**

Root defects in containers

- Circling
- Diving
- Ascending
- Kinks

Diving

**Lets wash
this
container
out**

Few lateral roots

**New roots primarily
coming out bottom
of liner pot**

Natural branching

Slow impact

Container branching

Ascending

Question: Can we develop a root system that resembles a natural root system? YES

Outline for today

- Current situation
- Growing systems
- Planting issues

So, yes we can grow a better root system

So want this instead of this?

**Big roots
distributed
vertically**

Gilman et al. 2014

**Big
roots at
bottom**

28 degree lean

Wood mass is more widely distributed in
root system on the left

Factors correlated with anchorage

- Straighter roots = more anchorage; $r = 0.84$
- Lower imprint rating = more anchorage; $r = 0.78$

Conclusion: Superior
root ball root system
shown above

Conclusion: Superior
root ball root system
shown above

Removing the outer “shell” of roots

Gilman et. al 2013

Root pruned Acer

No root pruning

Outline for today

- Current situation
- Growing systems
- Planting issues

We compared tree anchorage in wind

(Gilman and Masters 2010)

- Smooth-sided 45 gallon containers
- Field-grown (B&B)

..... planted three years earlier (2005).

Three years later

Largest portable wind tunnel in the world 3,000+ horsepower

\$500,000 machine

**Roots not
straight**

Straight roots

- 115 roots per tree
- Root diam. 8.3mm

In the nursery,
we need to start
managing roots
much earlier

Good

Not
good

Can we increase
anchorage with root
ball slicing? Gilman et al. 2010

Quercus:
Some sliced,
some not

Root ball slicing

Three years later

Trees pulled
to 25
degrees in
increments
of 5 degrees

Results

- Slicing root balls top to bottom did not result in more roots growing into landscape soil
- Sliced root balls were not better attached to the soil

Diving root that
was cut
generates new
roots July
2007

July 2007 –
close-up

July 2009 –
close-up

Summer 2013

15 gallon oaks into the landscape

3 treatments

Gilman et al. 2011

- No root pruning
- Slicing root ball
- Shaving root ball

Slicing
radially

Root ball
shaving
accomplishes
this

Shaving
tangentially

Shaving

Bending stress to pull trees over

Shaved at planting

The straighter the roots, the
better the anchorage

5 years after planting

Roots over flare
NOT removed at
planting

Roots over flare
removed at planting

Impact of initial tree size on growth, establishment, stability: *Acer* (2006-2012)

Gilman et al. 2013

- 3 gal.
- 25 gal.
- 65 gal.
- 300 gal.

16 blocks of 4 treatments

Randomized complete block design:
block 2 has 1 of each container size

Did anchorage depended on tree size at planting?

Trunk diameter growth first 6 years after planting

Trunk angle for 4 container sizes pulled at 5 stresses

**3 gallon at
planting**

A photograph showing the base of a tree trunk on the left, with its roots extending into the ground. A red dashed line is drawn in a semi-circle around the root system, indicating a specific volume of soil. The ground is covered with dry, brownish vegetation and some small green plants. The text "300 gallon at planting" is overlaid in the top right corner.

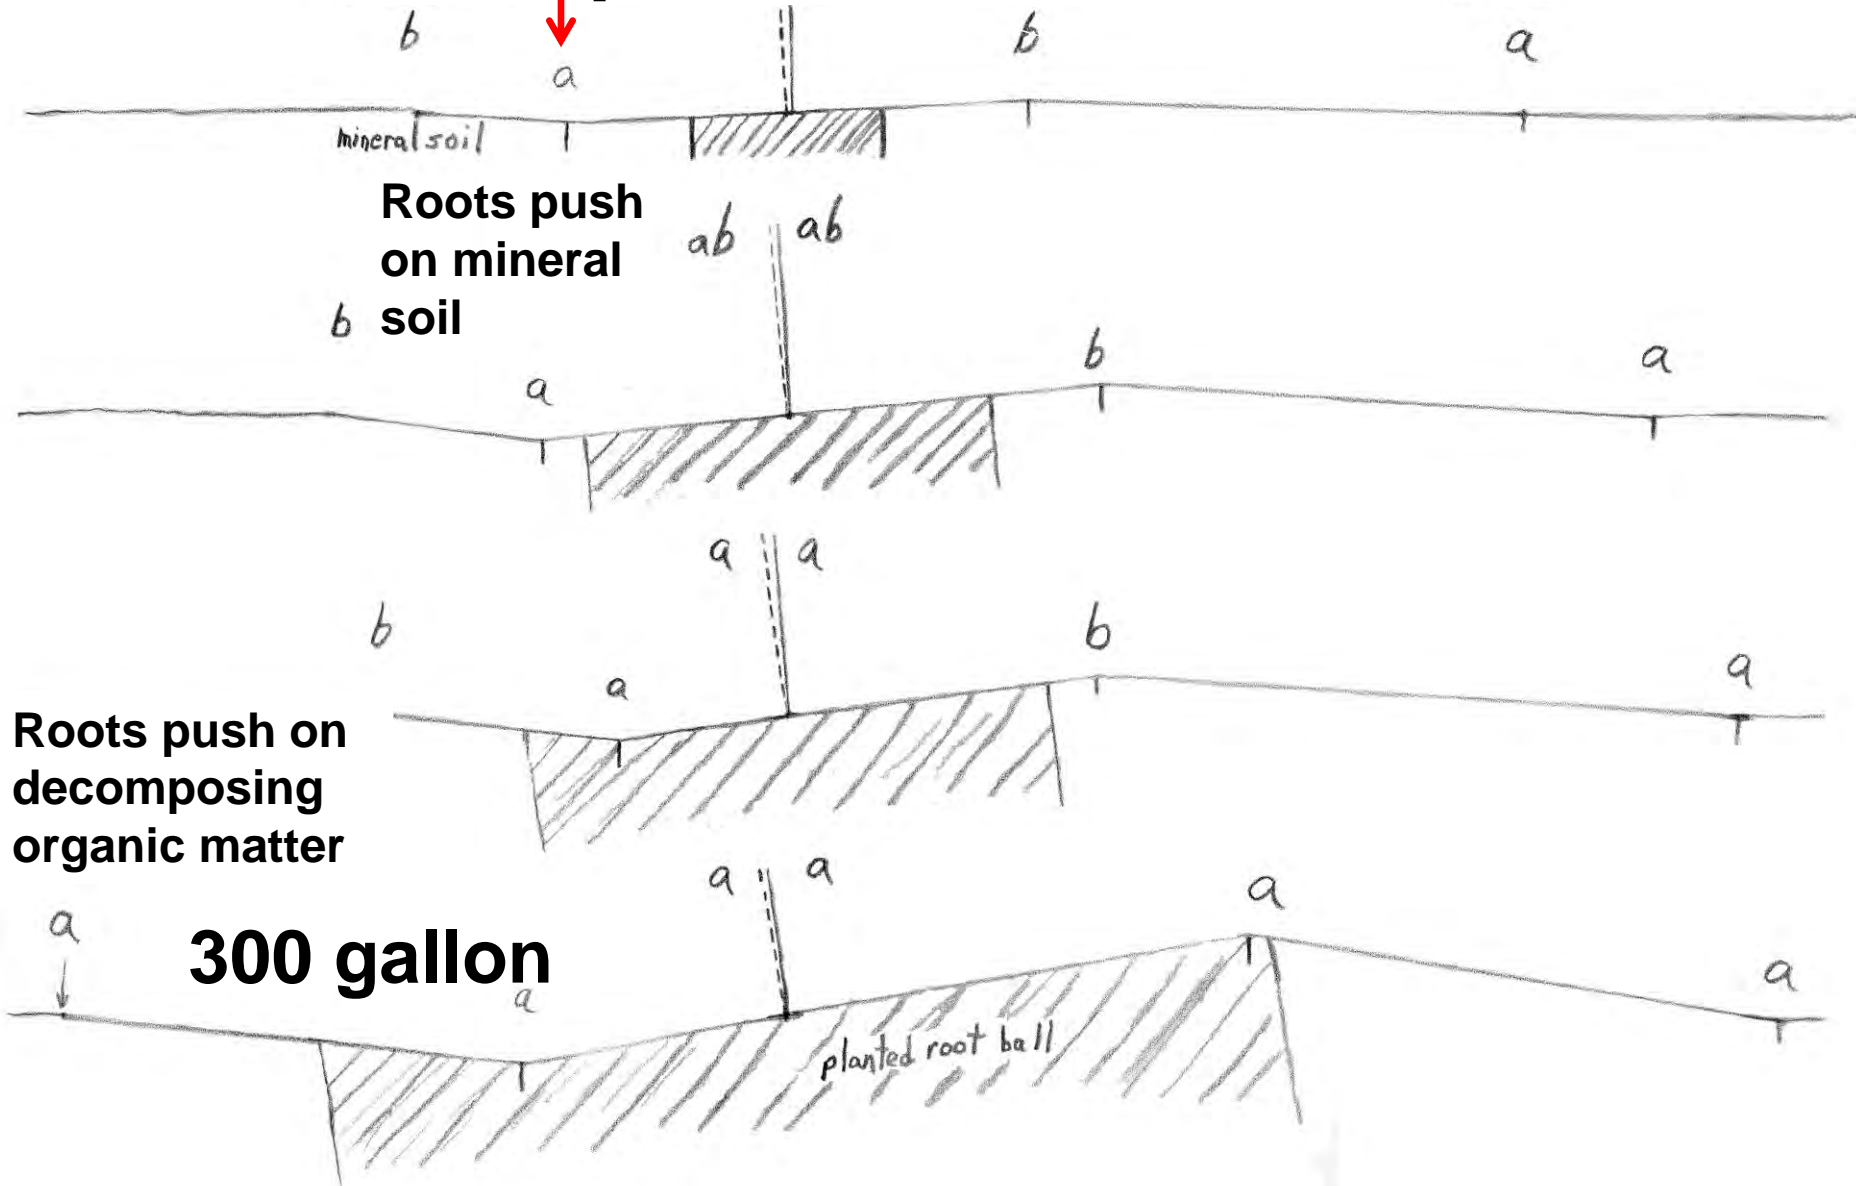

**300 gallon
at planting**

**300 gallon
at planting**

3 gallon

**Hinge
point**

In conclusion

- Large straight roots with some at the surface are important
- Write modern nursery stock specifications
- Write modern planting specifications

Gilman et
al. 2013

Thank you very much
